

# Decadal climate prediction studies at the Max Planck Institute for Meteorology

Reported by Marco Giorgetta

- Recent work by Holger Pohlmann et al. (submitted to J. Climate)
- Ongoing work by Daniela Matei
- Prospect for future climate prediction studies

## Improving Decadal Climate Predictability through the Initialization of a Coupled Model with the GECCO Oceanic Synthesis

Holger Pohlmann<sup>(1,2)</sup>, Johann Jungclaus<sup>(1)</sup>,  
A. Köhl<sup>(3)</sup>, D. Stammer<sup>(3)</sup>, J. Marotzke<sup>(1)</sup>

(1) Max Planck Institute for Meteorology, Hamburg, Germany

(2) Now at Met Office Hadley Centre, Exeter, UK

(3) Institute of Oceanography, ZMAW, Univ. Hamburg, Germany

- Are decadal hindcast experiments for the transient 20th century closer to the assimilation experiment than a control run which is not initialized?
- This implies the questions for which variables, where, and for how long the initialization (of the ocean) bears an advantage.
  - ECHAM5/MPI-OM climate model (~ MPI-M IPCC AR4 model)
  - GECCO ocean synthesis 1952-2001
  - 10 year hindcasts and forecasts (forecast: cf. James' presentation)
  - Compare hindcast skill against skill of uninitialized 20th century simulations and against skill of persistence
    - **Northern Atlantic annual mean SST**
    - annual mean Atlantic MOC (Sv) at 48°N
    - global and annual mean SST

# Pohlmann et al.: Experimental design

<i>Experiments</i>	<i>Initialization</i>	<i>Forcing</i>	<i>Amount</i>	<i>Period</i>
<b>Control</b>	In 1900, 1910 and 1920 from an IPCC AR4 20th century simulation	GHG + aerosol	3	1900 – 2011
<b>Assimilation</b>	In 1952 from Control (initialized in 1900)	GHG + aerosol and T + S from ECCO	1	1952 – 2001
<b>Hindcast</b>	At the end of every year from Assimilation	GHG + aerosol	49 / 40	10 years duration
<b>Forecast</b>	At the end of Assimilation	GHG + aerosol	7	2002 – 2011

**Surface air temperature difference** between the **control integration** and the **CRU climatology**, for the average over the period **1961-1990**.

# Pohlmann et al.: North Atlantic annual mean SST ( $^{\circ}\text{C}$ )

## Time series

----- HadISST  
— Assimilation  
— **Control**

## Anom. Cor. | RMSE

----- H-cast/HadISST  
— H-cast/Assim  
----- **Ctrl/Assim**      ----- 95% CL  
█ Persistence

— h/f cast  
year 1

— h/f cast  
year 1-5  
— h/f cast  
year 5-10

— h/f cast  
year 1-10

- H-cast/assim. anomaly correlation coefficients are worse than h-cast/obs.
- ❖ SST of assimilation run, driven by GECCO synthesis, differs too much from observations
- ❖ GECCO assimilation procedure allows for too large deviations
  
- ❖ GECCO data only applicable in ice free regions
- ❖ Current GECCO data end in 2001
- New GECCO planned by D. Stammer and A. Köhl
  
- Need for global ocean synthesis
- Smaller deviations from observations

- **New aspects:**
  - Use same model for synthesis and h/f casts
  - Extend assimilation run until 2007
- Build surrogate ocean synthesis
  - MPIOM simulations forced by NCEP/NCAR reanalysis
    - ◆ Surface heat flux from bulk formula → SST
    - ◆ Freshwater flux (incl. 50 largest rivers)
    - ◆ Surface salinity relaxed to obs. climatology
  - 10 member ensemble 1947-2007
- Assimilate daily **ensemble mean 3D fields of T + S and sea ice** (thickness + concentration) into ECHAM5/MPIOM using the **anomaly assimilation method**.
- Hindcast and forecasts similar to Pohlmann et al.
  - Assimilate ensemble mean data
  - Assimilate data from single ensemble members

## Prospect for future climate prediction studies in Hamburg

- CLISAP: Integrated Climate System Analysis and Prediction
  - Large scale 5 year research project at U. Hamburg with participation of MPI-M
  - **Plans to develop a climate monitoring and prediction system**
- CSC: Climate Service Centre  
BMBF funded 5-year project, possible tasks:
  - dissemination of of data
  - Regionalization
  - large scale or quasi-operational simulations for the German research community
- BMBF program for climate prediction (scheduled for 2009 – ? )
- “COMBINE” proposal to European commission: Develop/test different initialization and bias correction methods, climate predictions and sensitivities to model improvements (stratosphere, ...)
- “Storm” project of German research consortium: Explore benefits of high spatial resolution for climate simulation and climate prediction (Atmosphere > T250, Ocean ~0.1°)

# Summary

- Climate prediction is a hot topic
- Funding agencies (EC, BMBF, DFG) and institutions are investing
- Challenges
  - Biases in climate models (= general problem)
  - Data assimilation in ocean model or in coupled model
  - Quantification of uncertainties in analysis products, and in predictions
  - Dissemination: make useful predictions
  - Education: Shortage of students and scientists
